

# autodecco

The interior design software

## An essential tool for professional designers and space planners.

autodecco® is an essential tool for professional designers and space planners. With autodecco®, users accelerate the design phase and meet customer expectations by sharing previews of an interior design before actual work begins.

autodecco® is also used to visualize product displays in a virtual environment.

# autodecco 3.0

autodecco includes Autodesk technology. The program is stand-alone and operates without the need of any additional licenses. autodecco has all the power, flexibility and compatibility of other AutoCAD®-based applications plus an intuitive, icon-based interface. All of this at a very competitive price.

 **Fast and accurate drawing of the architecture:** walls, floor, ceiling, doors and windows, with different finishes to create photo-like images.

 Any combination of **materials and finishes** from floor to ceiling: tiles, paint, brick, wood.

 **See the design from different views** (floor plan, elevations, or perspectives), in up to four

 Easily edit or **change any element** (reference number, dimension, or finish).

 **Simple, powerful tool** for manually placing elements that automatically line up with the walls and other previously inserted elements. It's also possible to place elements automatically at any distance from the wall or other element. The program will tell you if there is any interference from another element in the design.

 Automatic **insertion of lights:** recessed, fluorescent, spot, halogen. The lights can be adjusted all at once or one at a time.

 **Extensive library of finishes/materials:** tiles, marble, granite, wood, and paint. In the PRO version you can add finishes with a digital camera.

 Tools to insert **dimensions, notes** for fitters, **installation symbols and codes.**

 **Printing of floor plans, elevations, perspectives and photo-like images.**

 **Highest quality photo-like images**, including shading and reflection. Ability to "walk through" the design visualizing the finishes.

 **Estimate** is generated instantly, including complete information about all elements of the design and different levels of detail depending on what you want to show.(optional).

 autodecco includes several tools to draw the architecture of a room or rooms with total accuracy. You can draw from scratch or use one of several available architectural templates and enter the dimensions of each segment and the exact angles of each wall. If the exact angles are not known, there are tools to perform a triangulation and derive the exact angle that way. There are several door and window models to choose from. You can also import windows or doors designed in AutoCAD®. All architectural elements can easily be modified after being placed.

**Placing furniture** in the design is fast and straightforward. The selected object to be placed automatically rotates as you drag the object through the design. There is a snap function which, once activated, places the furniture precisely against the desired wall or object.

Furniture can also be placed on automatic mode: adjacent to the last furniture element placed or directly above the last element placed, at a predefined distance.

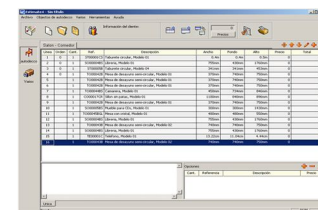

With autodecco Pro, groups of cabinets or furniture can be defined and exported to other designs with ease. The export can be done as a block of furniture or as individual objects.

You will be able to complete a design rapidly and print drawing plans from different views (elevations, floor plans, 3D) with all dimensions, references, notations, electrical outlets and other details. High quality color renderings can also be produced rapidly with autodecco.

The **printing function** allows you to print views or photos, specifying the scale, color or black and white, paper format and logo box. It's also possible to print the view that's actually on your screen, automatically scaled to your paper size, by specifying the format, orientation, and whether or not you want to hide lines.

Estimate 4.0 is available as an option with the Pro and Studio versions. autoQuote automatically generates an item list and quote of any autodecco design. The cabinets can have one or more reference code. It's also possible to create a quote

Item lists and quotes can be printed with different layers of information depending on what you want to show your clients or dealers.

**The drawings can be done in inches or centimeters;** autodecco will adapt them to the unit of measure in the design. The different finishes that should be applied to the objects are defined in the catalog. This allows you to use one AutoCAD® drawing (without finishes) to create a catalog of models that are differentiated by the colors and finishes that you use.

**autodecco Pro** includes a **Catalog Editor** that allows you to create and upload furniture created in Autocad. This function will save you time and money building and maintaining your catalogs.
